

SmartTest

**Helium Leak Detector.
The ingenious solution to your quality assurance.**

**Modular concept.
Simple operation. Top performance.**

PFEIFFER  **VACUUM**

Helium leak detection the easy way

With its modular design, ease of operation and modern optics, the SmartTest is setting new standards in vacuum leak detection.

A broad selection of interfaces affords simple system integration. The key advantages for you include minimum service requirements, robust engineering and the utmost in dependability.

Fast, reliable results, lowest detectable leak rates and short recovery time are what characterize the SmartTest and make it such a powerful and dependable product.

Take advantage of the opportunity for an on-site product presentation at your facility. It's the best way to experience the SmartTest in action!

reddot design award
winner 2005

SmartTest – Winner of the 2005 reddot design award in the "product design" category.

Modular concept

A variety of configurations offers the optimum solution for your application:

- ▶ with a rotary vane pump, for general leak detection
- ▶ with a dry pump, for absolutely oil-free leak detection
- ▶ without a backing pump, for use in leak detection systems

The bypass option affords fast leak detection when testing large, contaminated items.

In addition, this concept is supplemented by a remote control unit, a cart and a selection of various sniffer probes.

Simple operation

With its eight basic setting keys, you only have to program your SmartTest once. The ZEROING KEY enables you to display even the smallest leaks.

The START/STOP function offers a simple and secure way to start and stop the measurement.

ZEROING KEY for suppressing the background signal

One-key operation START/STOP

Helium leak detection – the right test method for every application

Selection of the appropriate quality assurance method for products and production processes is based upon the nature and size of the item to be tested.

In helium leak detection, a distinction is made between two different test methods – integral and local leak detection.

Integral leak detection for determining the total leak rate

The item to be tested is placed in a test chamber, filled with helium to test pressure and tested for leaks. The helium, which can egress through even the smallest leaks, reaches the SmartTest unit, enabling leak detection rates of down to 10^{-12} mbar l/s*.

The integral leak detection is suitable for either sniffer leak detection or vacuum leak detection.

- ▶ Measurement of the total leak rate in smaller test items
- ▶ Clear GO/NO-GO indication
- ▶ Highest objective measurement accuracy
- ▶ Short cycle time

Sniffer leak detection

- ▶ Overpressure-resistant test item
- ▶ Use of a sniffer probe
- ▶ Detection limit $< 5 \cdot 10^{-8}$ mbar l/s

Vacuum leak detection

- ▶ Vacuum-tight test item
- ▶ Test item filled with helium
- ▶ Detection limit $< 5 \cdot 10^{-12}$ mbar l/s

* 1 mbar l/s = 0.1 Pa m³/s = 0.987 sccs

Helium – the ideal test gas

Only a minute percentage of this gas is contained in the atmosphere, enabling even the smallest leak rates to be identified. Because of their very low atomic mass, helium atoms move through the air at higher speed. This ensures very fast measurements.

Further advantages at a glance:

- ▶ Utmost sensitivity in identifying even the smallest leaks
- ▶ Quantification of the leaks
- ▶ Outstanding reproducibility of the measurement
- ▶ Helium test gas is non-toxic and non-flammable
- ▶ Short measurement times

Local leak detection for identifying individual leaks

Sniffer leak detection is performed by filling the item to be tested with helium and testing with a sniffer probe.

In vacuum leak detection, the item to be tested is first evacuated and then sprayed with helium. This enables leaks to be localized and analyzed with the aid of the sniffer probe. Local leak detection identifies leaks of down to 10^{-12} mbar l/s* and provides precise information about the size and location of any leaks.

The local leak detection, too, is also suitable for either sniffer leak detection or vacuum leak detection.

- ▶ Precise localization of the leak site in large test items
- ▶ Indication of the exact magnitude of the leak
- ▶ High measurement accuracy
- ▶ Repetitive production defects can be easily identified

Sniffer leak detection	Vacuum leak detection
▶ Overpressure-resistant test item	▶ Vacuum-tight test item
▶ Use of a sniffer probe	▶ Spraying with helium
▶ Detection limit $< 5 \cdot 10^{-8}$ mbar l/s	▶ Detection limit $< 5 \cdot 10^{-12}$ mbar l/s

* 1 mbar l/s = 0.1 Pa m³/s = 0.987 sccs

General technical data

	HLT 550 – 575
Smallest detectable leak rate for He	$< 5 \cdot 10^{-12}$ mbar l/s
Test method	Vacuum and sniffing leak detection
Detectable gases	^4He , ^3He , H_2
Internal He-Test leak	10^{-7} mbar l/s
Leak rate display	10^{-12} – 1 mbar l/s
Cold start to ready	3 min
Response time	0.5 s
Pumping speed: for He	2.5 l/s
Flange (in)	DN 25 ISO-KF
Inlet pressure max.	25 mbar
Ambient temperature	+10 to +35 °C in process
Input: Analog	Compact Gauge
Input: Digital	Start/Stop, Zero, Calibration, bypass identification
Interface	RS-232-C, RS-485
Output: Analog	Leak rate signal 2 x 0–10 V, lin/log
Output: Digital	Ready to start, Ready to measure, Leak, Error, Bypass valve
Relay: Switching capacity	2 x 230 V AC
Relay: Switching current	3 A

Vacuum is nothing, but everything to us!

Pfeiffer Vacuum has been setting technological milestones for creating, measuring and analyzing vacuum for over 100 years. Our comprehensive product range covers individual components to complex vacuum systems.

Quality and service worldwide from the inventor of the turbopump: Pfeiffer is the international market leader with more than 250,000 turbopumps sold to date.

Take advantage of the opportunity for an on-site product presentation at your facility. It's the best way to experience the SmartTest in action!
